LED Circuit Design

LED Circuit Design

Performance variance is due to:

- Materials used
- Manufacturing process

Try to use LED's from the same batch
and from reliable manufacturers

Ohm's Law

How to Calculate LED Resistance

$$V = RI$$

$$R = V/I$$

$$R =$$

$$\frac{V_{(\text{Supply})} - V_{(\text{LED})}}{I_{(\text{Current})}}$$

(.02 amps)

LED Circuit Design

What size resistor is needed?

$$\text{Resistor voltage drop} = 3\text{V} - 2\text{V} = 1\text{V}$$

$$\text{Resistor} = 1\text{V} \div 0.02\text{A} = 50\Omega$$

$$\text{LED Voltage drop} = 2\text{V}$$

$$\text{LED current} = 20\text{mA} (0.02\text{A})$$

TheEngineeringMindset.com

LED Circuit Design

Voltage drop = 2V
Current = 20mA

What size resistor is required?

Resistor voltage drop: $9V - 2V = 7V$

The current required is 20mA

Resistor value = $7V \div 0.02A = 350\Omega$

TheEngineeringMindset.com

LED Circuit Design

Calculation:

$$3V - 2V = 1V$$

$$1V \div 0.02A = 50\Omega$$

3V battery
can only power
1 LED at 20mA

Calculation:

$$9V - 2V - 2V - 2V - 2V = 1V$$

$$1V \div 0.02A = 50\Omega$$

LED Circuit Design

$$\text{Resistor voltage drop} = 9\text{V} - 2\text{V} = 7\text{V}$$

$$\text{Resistor value} = 7\text{V} \div 0.02\text{A} = 350\Omega$$

$$\text{Resistor power} = 0.02^2 \times 350\Omega = 0.14\text{W}$$

$$\text{Total current} = 0.02\text{A} \times 6 \text{ LED's} = 0.12\text{A}$$

 Voltage drop 2V, Current required 20mA

LED Circuit Design

Voltage drop

	2V
	3.4V
	3V

Each requires 20mA

Resistor 1

$$9V - 2V = 7V$$

$$7V \div 0.02A = 350\Omega$$

Resistor 2

$$9V - 3.4V = 5.6V$$

$$5.6V \div 0.02A = 280\Omega$$

Resistor 3

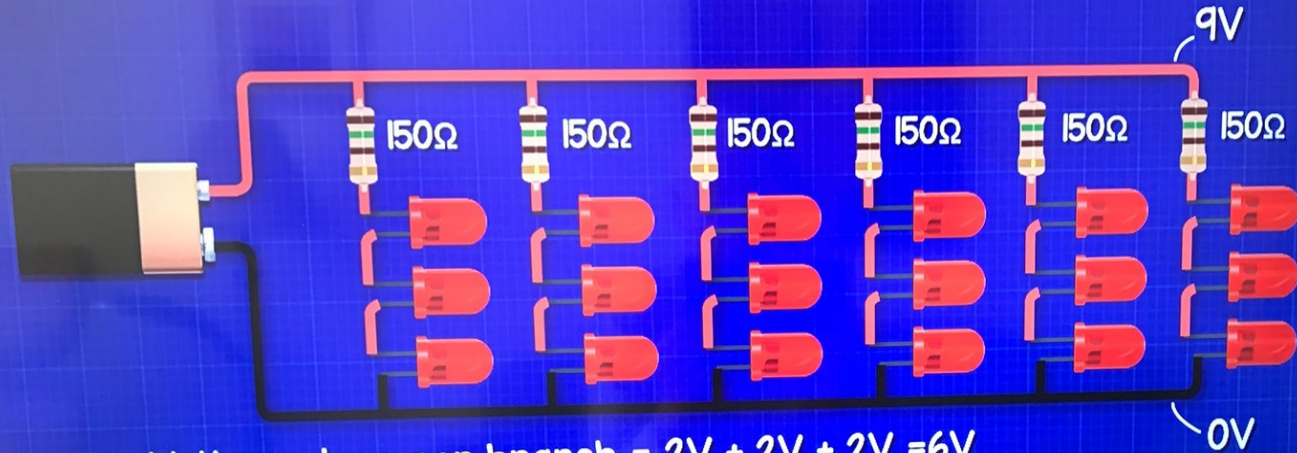

$$9V - 3V = 6V$$

$$6V \div 0.02A = 300\Omega$$

$$\text{Total current} = 20mA + 20mA + 20mA = 60mA$$

$$\text{Battery life} = 500mAh \div 60mA = \sim 8 \text{ Hours}$$

LED Circuit Design

$$\text{Voltage drop per branch} = 2V + 2V + 2V = 6V$$

$$\text{Resistor voltage drop} = 9V - 6V = 3V$$

$$\text{Resistor value} = 3V \div 0.02A = 150\Omega$$

Current per branch doesn't increase
so we can add more LED's
until maximum voltage drop

Voltage drop 2V, Current required 20mA

COST \$\$\$\$

Com Board - \$100

Input Bd - \$ 20

Input Cable - \$ 6

Output Cable - \$. 5

System \$200 +
(add light LED cost)

Lighting System - Logic Rail Technologies

COST \$\$\$

Light Hub - \$15

Exp Hub - \$14

Pwr Sup - \$20

Ext Cables - \$6

Light Switch - \$9

System Costs

\$100+

(add LED cost)

Lighting System - Woodland Scenics

The short lead is the cathode (-) Black
The long lead is the anode (+) RED
If LED has Flat Side: it is the cathode (-)

Type of wiring connectors used on the NWW layout

TYPES OF WIRE

Wire Cost

Magnet Wire - \$12 (800ft)

Twisted Wire - \$ 8 (30ft)

Coiled wire - \$10 (50ft)

LED Tape Cost

JUNWEN reel - \$14.95

Use - 50,000 hrs

Cut - 3 LEDS, 7 LEDS strips/ft, ~142 LEDS/reel

~ \$.11 per LED cut

Lighting Strips with SMDs

- Note :
- positive (+) and negative (-) terminals
 - : required forward voltage (don't exceed)
 - : attach to models using backing tape plus super glue
 - : use RED for anode and BLACK for cathode

Typical LED Lights
